ETHERNET VPN (EVPN)
OVERLAY NETWORKS FOR ETHERNET SERVICES
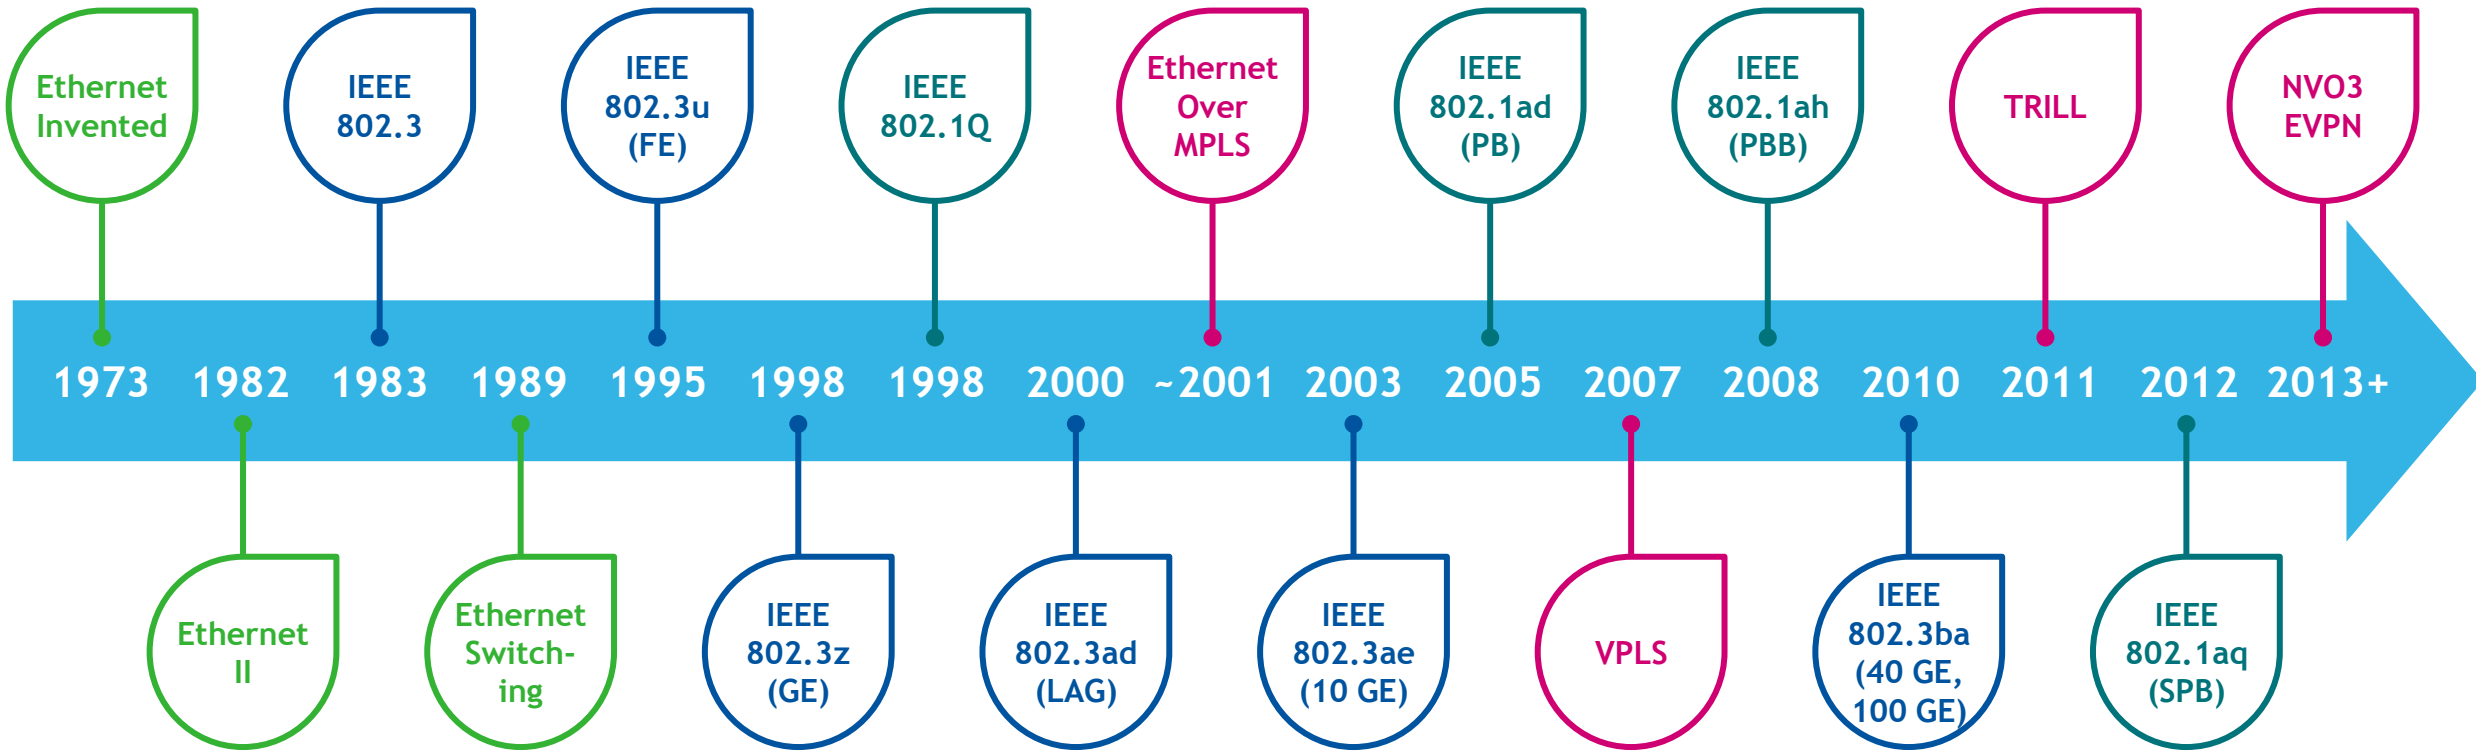

Greg Hankins <greg.hankins@alcatel-lucent.com>
RIPE 68

Alcatel·Lucent

AGENDA

1. **EVPN Background and Motivation**

2. EVPN Operations

3. EVPN Use Cases

Alcatel·Lucent

ETHERNET SERVICES TECHNOLOGY CONTINUES TO EVOLVE
HIGHER SPEEDS AND ADVANCED CARRIER-GRADE SERVICES

Timeline (top row):
- Ethernet Invented — 1973
- IEEE 802.3 — 1983
- IEEE 802.3u (FE) — 1995
- IEEE 802.1Q — 1998
- Ethernet Over MPLS — ~2001
- IEEE 802.1ad (PB) — 2005
- IEEE 802.1ah (PBB) — 2008
- TRILL — 2011
- NVO3 EVPN — 2013+

Timeline (bottom row):
- Ethernet II — 1982
- Ethernet Switching — 1989
- IEEE 802.3z (GE) — 1998
- IEEE 802.3ad (LAG) — 2000
- IEEE 802.3ae (10 GE) — 2003
- VPLS — 2007
- IEEE 802.3ba (40 GE, 100 GE) — 2010
- IEEE 802.1aq (SPB) — 2012

"The **widespread adoption of Ethernet L2VPN** services and the advent of **new applications** for the technology (e.g., data center interconnect) have culminated in a **new set of requirements** that are **not readily addressable** by the current Virtual Private LAN Service (VPLS) solution." — draft-ietf-l2vpn-evpn-req

Alcatel·Lucent

WHY ANOTHER VPN TECHNOLOGY?

- MPLS/VPLS and PBB are both proven technologies for Ethernet services, but

  - The control plane approach hasn't changed
  - Still relies on flooding and learning to build the Layer 2 forwarding database (FDB)

- EVPN introduces a new model for delivery of Ethernet services

  - Inherits a decade of VPLS operational experience in production networks
  - Incorporates flexibility for service delivery over Layer 3 networks
  - Abstracts and separates the control and data planes: MP-BGP carries MAC/IP routing information, choice of data plane encapsulation

- Enables network operators to meet emerging needs in their networks

  - Data center interconnect (DCI)
  - Cloud and virtualization services
  - Integrated Layer 2 and Layer 3 VPN services
  - Overlay technologies that simplify topologies, and remove protocols from the network

Alcatel·Lucent

EVPN KEY OPERATIONAL BENEFITS

Integrated Services

- Delivering Layer 2 and Layer 3 services over the same interface, VLAN and VPN
- L3VPN-like operation for scalability and control

Network Efficiency

- Multihoming with all-active forwarding, load balancing between PEs
- Optimized multidestination frame (BUM) delivery
- More efficient hybrid service delivery over a single interface or VLAN

Design Flexibility

- MPLS or IP data plane encapsulation choices
- VXLAN encapsulation enables EVPN over a simple IP network
- Simpler provisioning and management with a single VPN technology

Greater Control

- MAC/IP provisioning enables programmatic network control
- Consistent signaled FDB in control plane vs. flood-and-learn FDB in data plane
- Proxy ARP/ND functionality allows PEs to respond to ARP/ND requests

Alcatel·Lucent

EVPN STATUS

- Hot new technology in the IETF L2VPN WG

- Many mature base I-Ds and new I-Ds

  - draft-ietf-l2vpn-evpn base specification: WG last call for -07 on May 9, 2014
  - draft-ietf-l2vpn-evpn-req: no more changes expected
  - draft-ietf-l2vpn-pbb-evpn: no more changes expected

- Diverse authors on requirements and base specification

  - Vendors: Alcatel-Lucent, Cisco, Juniper
  - Network operators: Arktan, AT&T, Bloomberg, Verizon

- Shipping implementations

  - Alcatel-Lucent
  - Cisco
  - Juniper

EVPN DATA PLANES
ONE EVPN CONTROL PLANE WITH MULTIPLE DATA PLANE OPTIONS

Control Plane

EVPN MP-BGP
draft-ietf-l2vpn-evpn

Data Plane

Multiprotocol Label Switching (MPLS)
draft-ietf-l2vpn-evpn

Provider Backbone Bridges (PBB)
draft-ietf-l2vpn-pbb-evpn

Network Virtualization Overlay (NVO)
draft-sd-l2vpn-evpn-overlay

- EVPN over MPLS for E-LAN services
- All-active multihoming for VPWS
- RSVP-TE or LDP MPLS protocols

- EVPN with PBB PE functionality for scaling very large networks over MPLS
- All-active multihoming for PBB-VPLS

- EVPN over NVO tunnels (VXLAN, NVGRE, MPLSoGRE) for data center fabric encapsulations
- Provides Layer 2 and Layer 3 DCI and overlays over simple IP networks
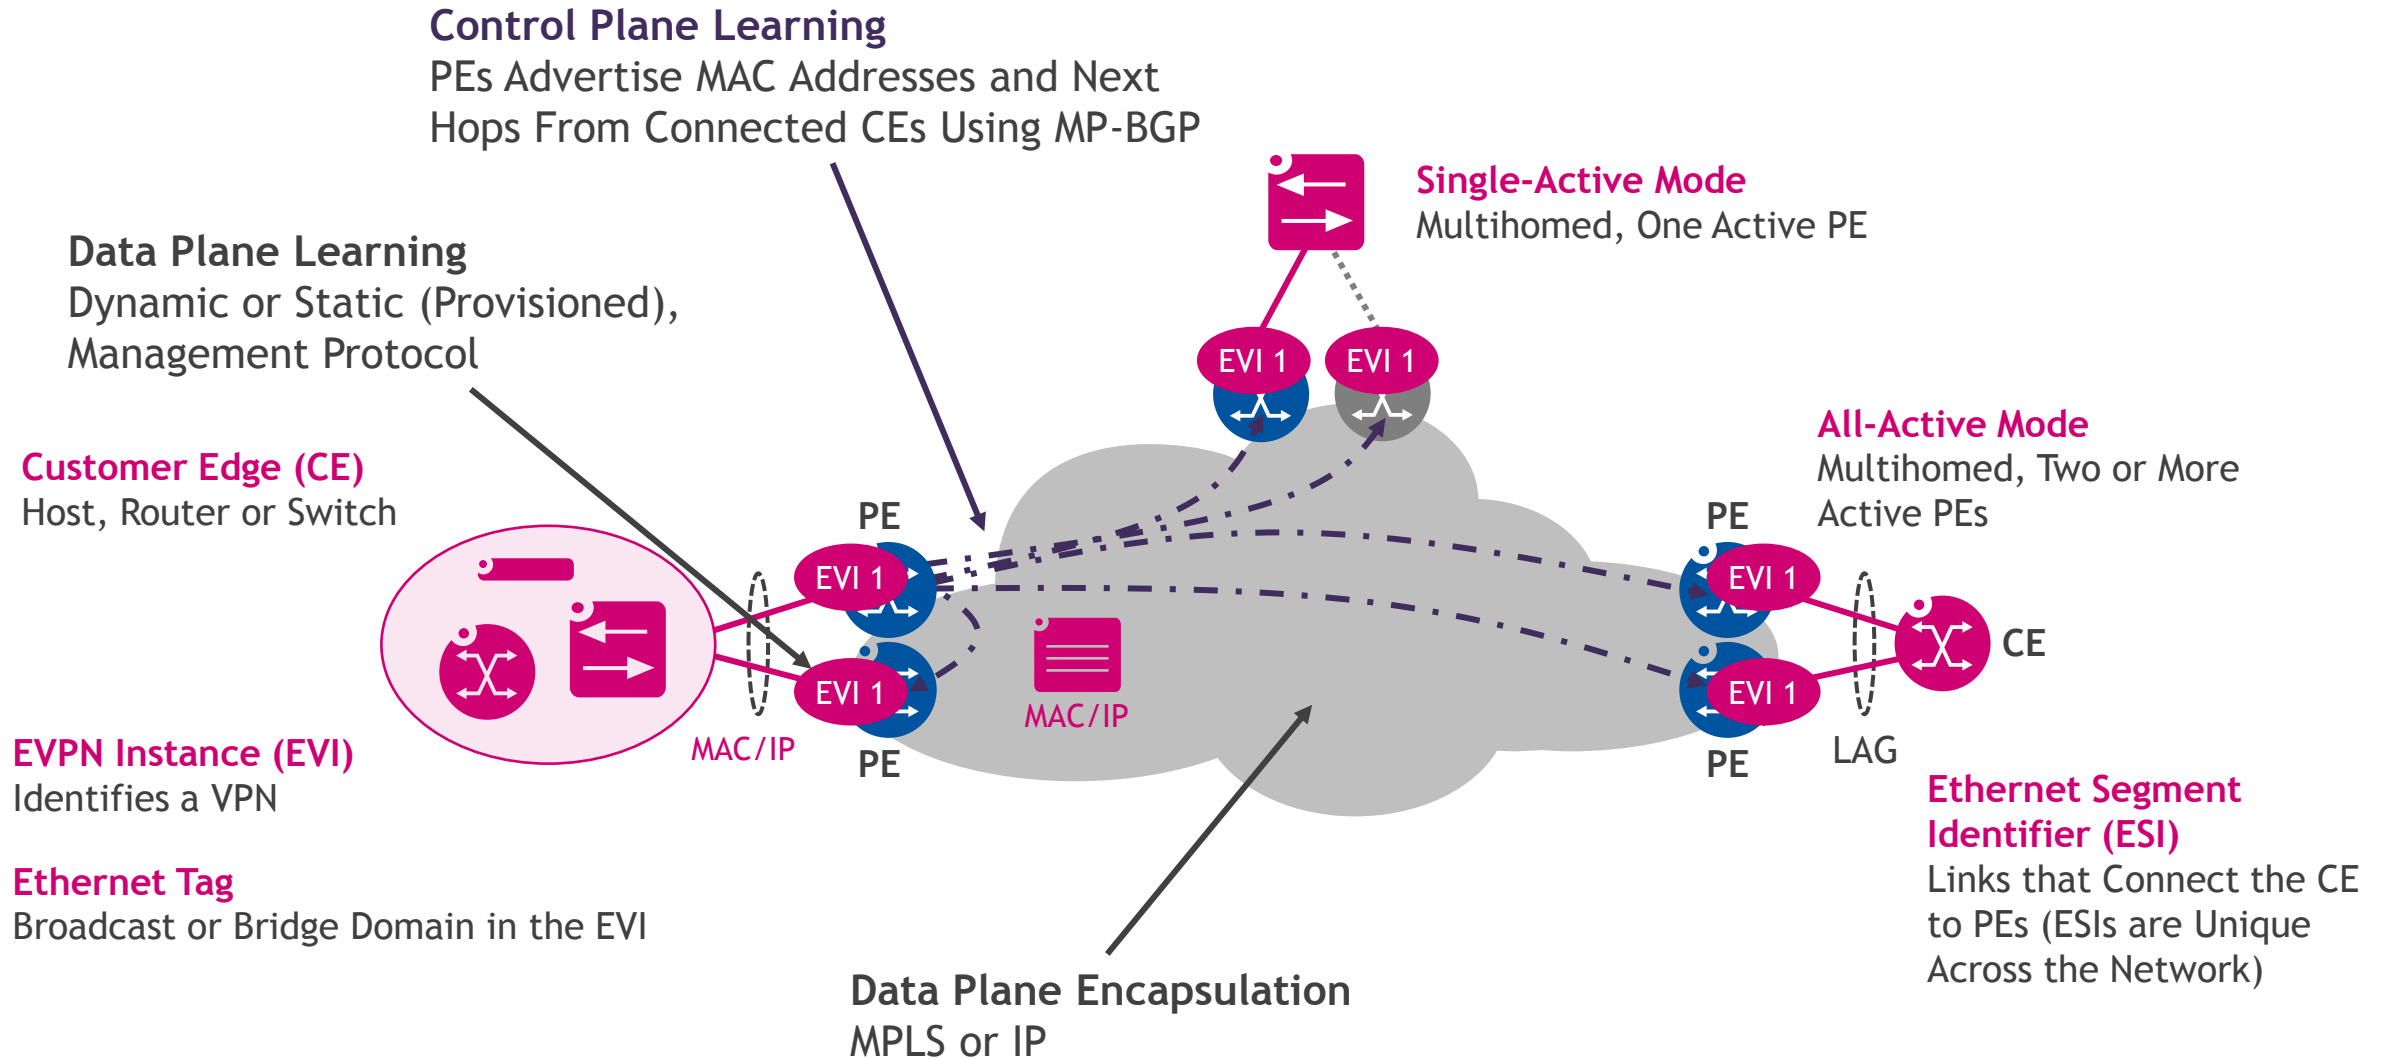

Alcatel·Lucent

EVPN CONTROL PLANE LEARNING WITH MP-BGP

- Brings proven and inherent BGP control plane scalability to MAC routes
  - Consistent signaled FDB in any size network instead of flooding
  - Even more scalability and hierarchy with route reflectors
- BGP advertises MACs and IPs for next hop resolution with EVPN NLRI
  - AFI = 25 (L2VPN) and SAFI = 70 (EVPN)
  - Fully supports IPv4 and IPv6 in the control and data plane
- Offers greater control over MAC learning
  - What is signaled, from where and to whom
  - Ability to apply MAC learning policies
- Maintains virtualization and isolation of EVPN instances
- Enables traffic load balancing for multihomed CEs with ECMP MAC routes
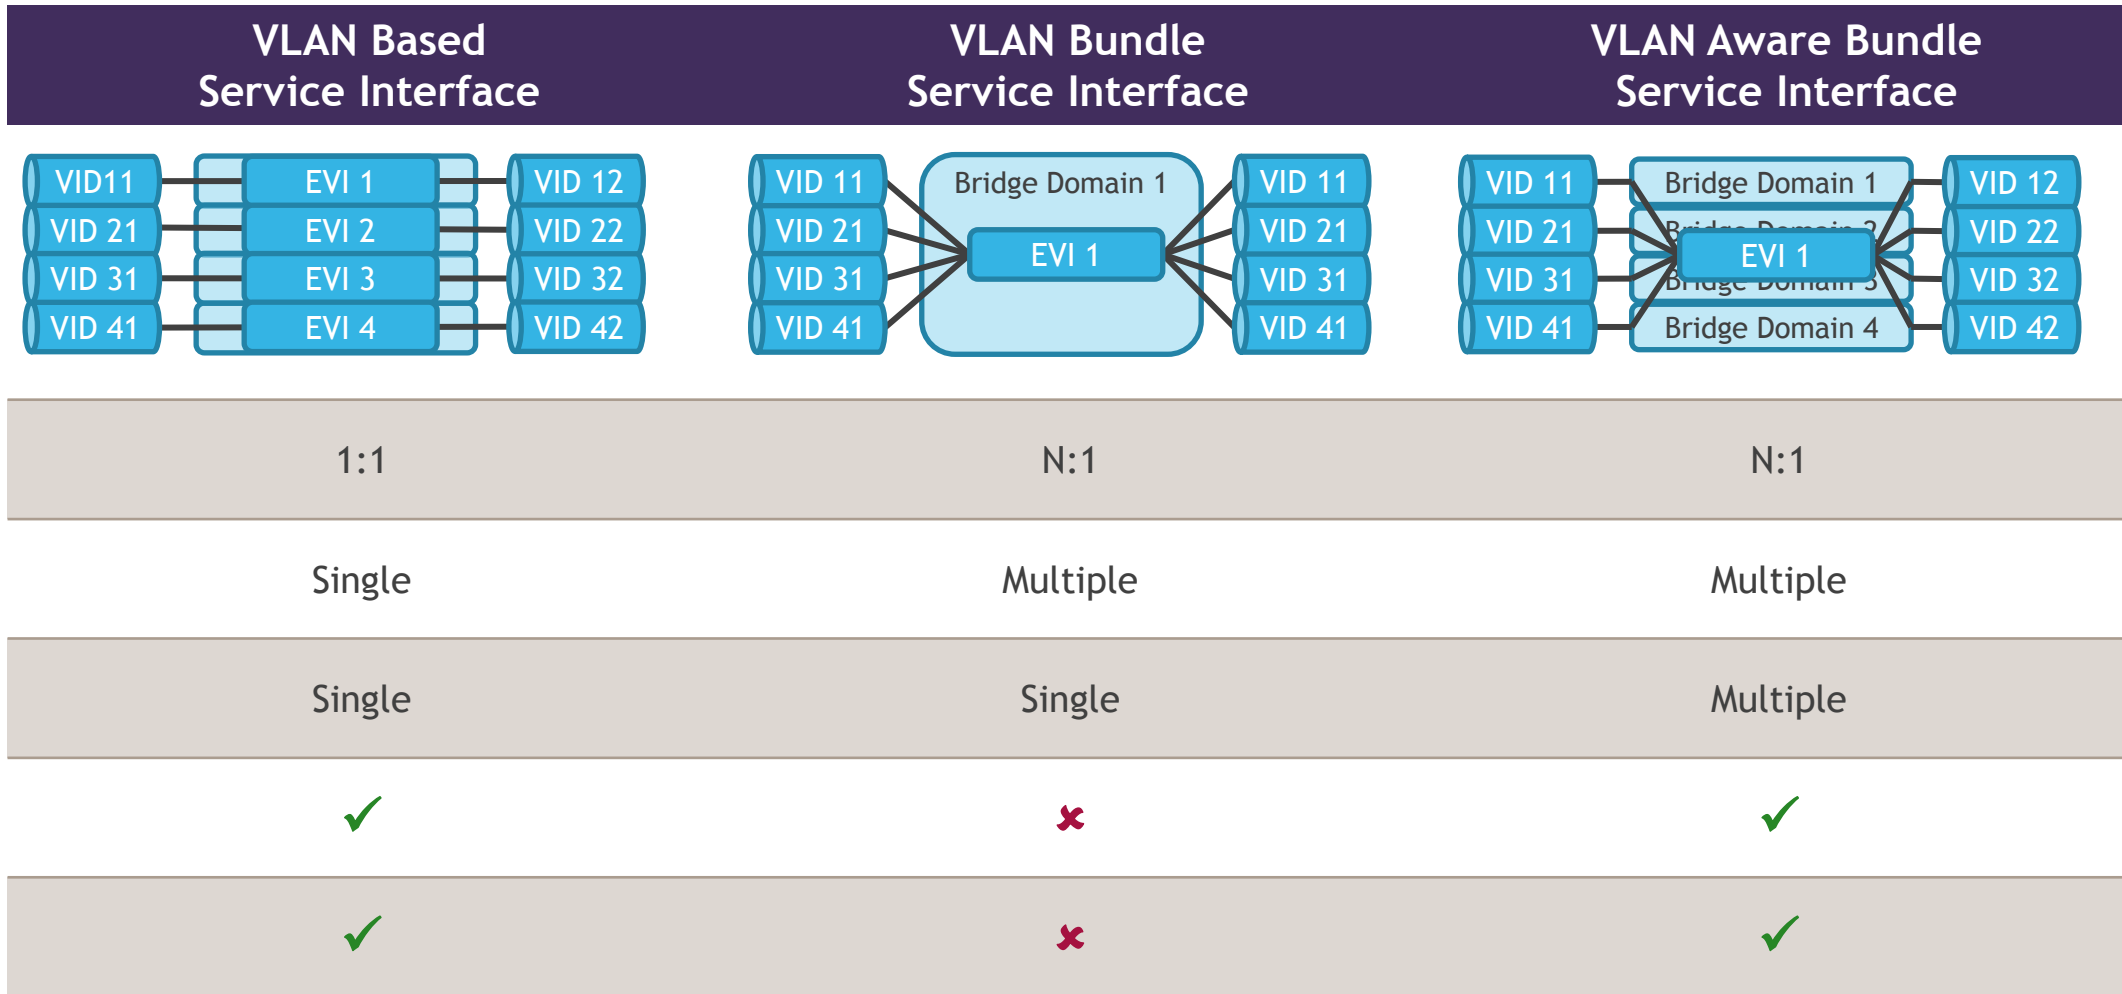

Route Distinguisher (8 octets)

Alcatel·Lucent

AGENDA

1. EVPN Background and Motivation

2. **EVPN Operations**

3. EVPN Use Cases

Alcatel·Lucent

EVPN OPERATION

- Key features control plane features

  - All-Active Multihoming and Designated Forwarder Election
  - All-Active Multihoming and Split Horizon
  - Proxy ARP/ND and Unknown Unicast Flooding Suppression
  - Aliasing
  - MAC Mobility
  - MAC Duplication
  - MAC Mass-Withdraw
  - Default Gateway Inter-Subnet Forwarding

- Data planes

  - MPLS: EVPN-MPLS
  - PBB: PBB-EVPN
  - VXLAN: EVPN-VXLAN

Alcatel·Lucent

EVPN OPERATION
ALL-ACTIVE MULTIHOMING AND DESIGNATED FORWARDER ELECTION

Duplicate BUM Flooding

BUM From Core to CE

DF

Blocks BUM Flooding
- Avoids duplicate BUM flooding to all-active CEs

- PEs connected to multihomed CEs know about each other through ESI routes

- Elects a designated forwarder (DF) responsible for BUM flooding to the Ethernet segment

- Non-DF PEs block BUM flooding to the CE

- Flexible DF election and functionality
  - Same DF for all ESIs
  - Different DF per ESI

- Unicast still follows all-active paths

Alcatel·Lucent

EVPN OPERATION
ALL-ACTIVE MULTIHOMING AND SPLIT HORIZON

Echoed BUM Traffic

BUM From CE to Core

Blocks Echo
- Ensures that BUM traffic from an ESI is not replicated back to the same ESI to an all-active CE

- PE advertises a split horizon label for each all-active Ethernet segment

- When an ingress PE floods BUM traffic, it pushes the split horizon label to identify the source Ethernet segment

- Egress PEs use this label for split horizon filtering and drop packets with the label destined to the Ethernet segment

- Implicit split horizon for core, since PEs won't flood received BUM traffic back into core

Alcatel·Lucent

EVPN OPERATION
PROXY ARP/ND AND UNKNOWN UNICAST FLOODING SUPPRESSION
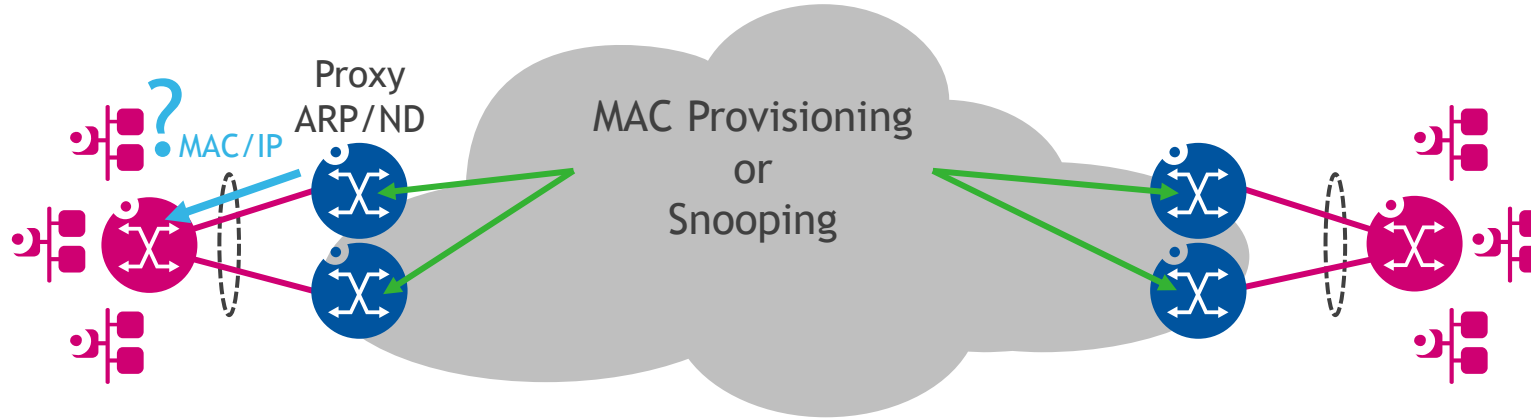

- ARP/ND is a security issue and a scalability issue in large networks
  - Unknown unicast traffic levels, especially in large data center and IXP networks
- We really don't need it anymore in orchestrated or provisioned networks where all MACs/IPs are known

- EVPN can reduce or suppress unknown unicast flooding since all active MACs and IPs are advertised by PEs
  - PEs proxy ARP/ND based on MAC route table to CEs
  - ARP/ND/DHCP snooping optimizes and reduces unknown unicast flooding, useful in dynamic data center networks
  - Provisioning MAC addresses can reduce or eliminate unknown unicast flooding entirely
  - Can disable learning and snooping for programmatic network control

Alcatel·Lucent

EVPN OPERATION
ALIASING

Knows MAC is Reachable via Ethernet Segment

MAC Learned

MAC/IP

MAC **Not** Learned

MAC/IP ESI
- Provides load balancing to all-active CE when the MAC address is only learned by one PE

    - First MAC learning by PE is usually from a Layer 2 broadcast (ARP/ND/DHCP)

    - Broadcasts are sent on the primary link in a LAG

    - Can have periods of time when the MAC is only learned by the PE connected to the primary link

- PEs advertise the ESI in MAC routes with all-active mode

- Remote PEs can load balance traffic across all PEs advertising the same ESI

    - Multipathing to CE always works, does not depend on random learning situations or hashing at CE

- Can also be used for a backup path in single-active mode with a standby link

Alcatel·Lucent

EVPN OPERATION
MAC MOBILITY

MAC/IP
Seq#
- MAC addresses may move between ESIs

- If local learning is used, the PE may not detect that a MAC address has moved and won't send a withdraw for it

- New PE sends a new MAC route

- Now there are two routes for the MAC address: an old wrong one and a new correct one

- Each MAC is advertised with a MAC mobility sequence number in an extended community with the MAC route

  - PE selects the MAC route with the highest sequence number

  - Triggers withdraw from PE advertising MAC route with the lower sequence number

  - Lowest PE IP address is used as the tie breaker if the sequence number is the same

Alcatel·Lucent

EVPN OPERATION
MAC DUPLICATION
- In certain bad situations, the same MAC could be learned by two PEs

  - MAC duplication
  - Rapid movement
  - Loops

- MAC duplication detection mechanism uses a configurable timer and move counter

  - Provides per-MAC duplication control vs. per-port control in Layer 2 bridging

- If five (*N*) moves (*M*) are detected in 180 s, then the MAC is considered duplicated (default timers)

- PEs stop advertising its route, PEs will use the route with the highest sequence number for forwarding

- Condition can be cleared manually or by implementing a retry timer to clear it automagically

Alcatel·Lucent

EVPN OPERATION
MAC MASS-WITHDRAW
Withdraw ESI

- Provides rapid convergence when a link failure affects many MAC addresses

- PEs advertise two routes
  - MAC/IP address and its ESI
  - Connectivity to ESIs
- If a failure affects an ESI, the PE simply withdraws the route for the ESI

- Remote PEs remove failed PE from the path for all MAC addresses associated with an ESI

- Functions as a MAC mass-withdraw and speeds convergence during link failures

- No need to wait for individual MAC addresses to be withdrawn

Alcatel·Lucent

EVPN OPERATION
DEFAULT GATEWAY INTER-SUBNET FORWARDING

Inefficient
Routing
- EVPN supports inter-subnet forwarding when IP routing is required

- No additional separate L3VPN functionality is needed, uses EVPN default gateway

- One or more PEs is configured as the default gateway, 0.0.0.0 or :: MAC route is advertised with default gateway extended community

- Local PEs respond to ARP/ND requests for default gateway

- Enables efficient routing at local PE

- Avoids tromboning traffic across remote PEs to be routed after a MAC moves, if all default gateways use the same MAC address

Alcatel·Lucent

# EVPN MULTIPROTOCOL LABEL SWITCHING (MPLS) DATA PLANE
DRAFT-IETF-L2VPN-EVPN (EVPN-MPLS)
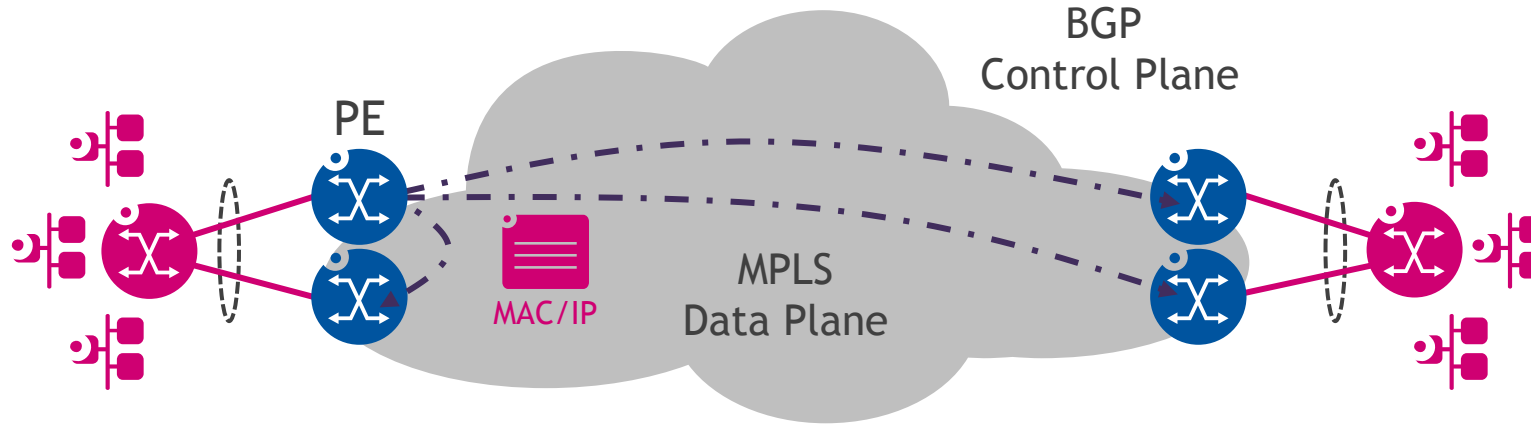

- EVPN over an MPLS data plane is the original EVPN solution in the base specification

- Requires IGP, RSVP-TE or LDP, BGP

- No pseudowires

- MPLS runs in the core network's control plane and data plane

- Core network supports all the MPLS features we know and love, since EVPN uses MPLS as the data plane (TE, FRR, …)

Alcatel·Lucent

PROVIDER BACKBONE BRIDGES (PBB) EVPN DATA PLANE
## DRAFT-IETF-L2VPN-PBB-EVPN (PBB-EVPN)
- PBB-EVPN combines IEEE 802.1ah PBB with EVPN

- PEs are PBB Backbone Edge Bridges (BEB)

- Reduces number of MACs in EVPN by aggregating customer MACs with backbone MACs

  - Same concept as route aggregation in IP

- Scales EVPN networks to a very large number of MACs

  - PEs only advertise backbone MACs with BGP
  - Customer MAC and backbone MAC mapping is learned in the data plane
  - Useful for providing services to networks where the MACs are not under your control

- MPLS runs in the control plane and data plane

Alcatel·Lucent

EVPN VIRTUAL EXTENSIBLE LAN (VXLAN) DATA PLANE
DRAFT-SD-L2VPN-EVPN-OVERLAY (EVPN-VXLAN)

BGP
Control Plane

PE

MAC/IP
VXLAN
Data Plane

- EVPN-VXLAN uses EVPN over a VXLAN data plane

  - VXLAN is typically used for data center extension over WAN
  - Can also be used as an overlay in any IP network for IP/Ethernet services
  - Useful when MPLS is unavailable or unwanted
  - Alternative to NVGRE or MPLSoGRE (NVO3)
  - PIM is not needed with ingress BUM replication

- VXLAN provides the Layer 2 overlay over IP

  - IP reachability is required between PEs
  - EVPN uses BGP control plane for MAC route advertisements
  - VXLAN data plane uses UDP to encapsulate the VXLAN header and Layer 2 frame

- Provides all the benefits of EVPN for DCI and virtualized networks

Alcatel·Lucent

VXLAN DATA PLANE FLEXIBILITY

| IPv4 or IPv6 Header	UDP Header	VXLAN Header	Payload

- VXLAN encapsulates Ethernet in IP

  - Runs over IPv4 or IPv6 and uses UDP

  - Source port in ranges 49152 – 65535 is a hash of fields from the encapsulated frame to provide load balancing entropy

  - Destination port is 4789

  - 8 byte VXLAN header provides 24 bit VXLAN Network Identifier (VNI) and flags

- VXLAN is routable with IP, so the underlay network may be any network that uses existing resiliency and load balancing mechanisms

  - ECMP

  - IGPs/BGP

  - IP FRR

- VXLAN tunnel endpoints can be on network equipment or computing infrastructure

  - Deliver a VPN to a hypervisor attached to a VM

2001:db8:414c::1/128
00:0c:29:89:ac:0b

Data Center 1

IP Network

Data Center 2

- Enables scalable Layer 2 or Layer 3 DCI services for virtualized data centers

- IP/MAC mobility for VMs that move between data centers

  - Faster moves while maintaining correct FDB on all routers

- Local IP gateway at each PE optimizes routing

- Provides all the benefits of EVPN for DCI and virtualized networks

  - All-active multihoming
  - Eliminates ARP/ND flooding for MAC learning
  - Integrated Layer 2 switching and Layer 3 routing over the same interface or VLAN

Alcatel·Lucent

BUSINESS SERVICES AND INFRASTRUCTURE NETWORKS
## LAYER 2 AND LAYER 3 SERVICES
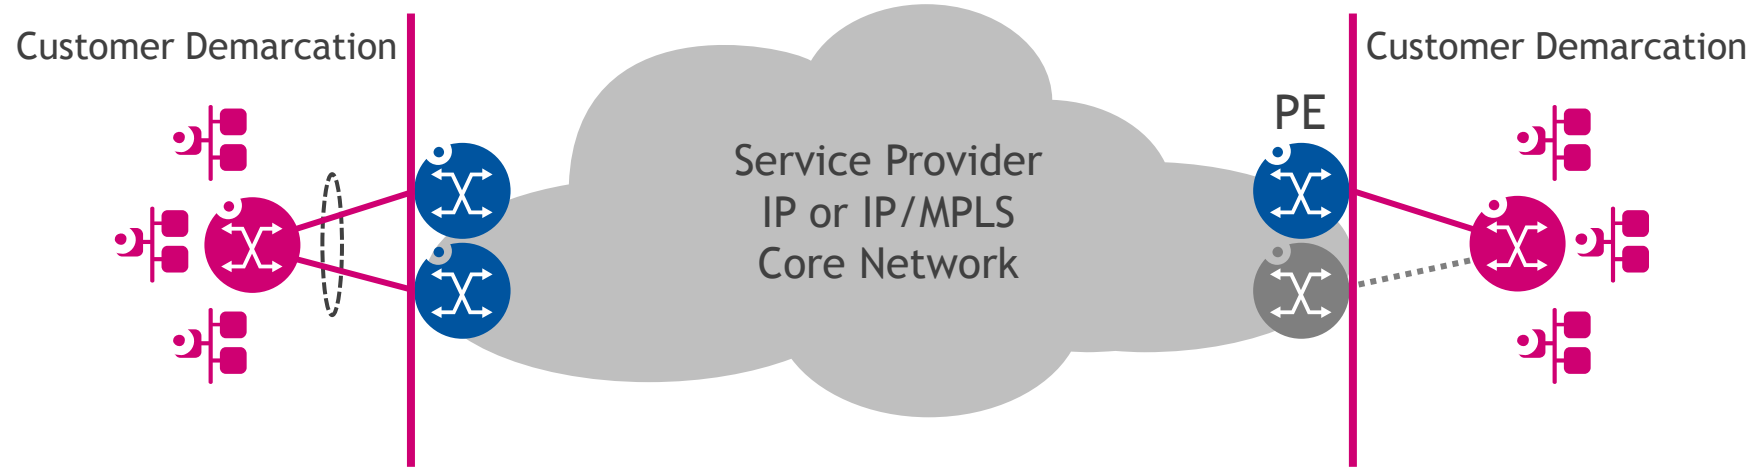

- EVPN enables service providers to offer integrated Layer 2 and Layer 3 services
  - Single interface, single VLAN to customer
  - One technology for both services, no need for multiple VPN protocols
  - All-active or single-active PE to CE connection

- EVPN service can be provided over any core network
  - MPLS core can use EVPN-MPLS
  - IP core can use EVPN-VXLAN

Alcatel·Lucent

SITE TO SITE NETWORKS OVER IP
FLEXIBLE LAYER 2 AND LAYER 3 NETWORKS

BGP Control Plane

PE

CE

PE

CE

PE

CE

VXLAN Data Plane

- EVPN-VXLAN works over any IP service to provide a flexible site to site network

- Just requires IP connectivity between sites, no MPLS or any special configuration by IP service provider

  - Service provider network is transparent to EVPN

  - EVPN overlay is transparent to service providers

- VPN routing between endpoints can be controlled with BGP and routing policies to service providers

- Routing and MAC/IP advertisement within EVPN controlled via IBGP between PEs

Alcatel·Lucent

SUMMARY

- EVPN provides next-generation VPN solutions for Layer 2 and Layer 3 services over Ethernet
  - Consistent signaled FDB in control plane using MP-BGP vs. flood-and-learn FDB in data plane
  - L3VPN-like operation for scalability and control
  - Flow-based load balancing and all-active multipathing
  - Delivering Layer 2 and Layer 3 services over the same interface, VLAN and VPN
  - Simpler provisioning and management with a single VPN technology
  - ARP/ND security and MAC provisioning
  - MPLS or IP data plane encapsulation choices

Alcatel·Lucent

INTERNET EXCHANGE POINT
PEERING FABRIC
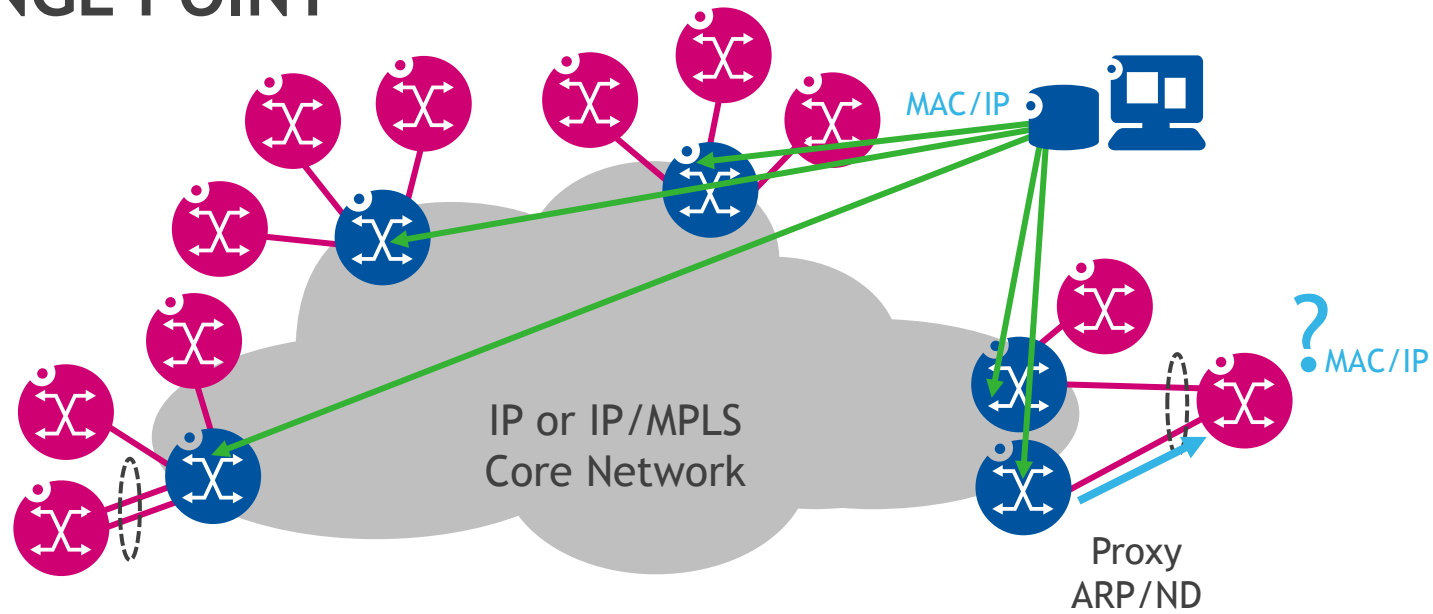

- Provides Layer 2 interconnection over an EVPN peering fabric

  - IP/MPLS core network with MPLS data plane
  - IP core network with VXLAN data plane

- Supports single or all-active multihoming to the peering fabric VLAN

- Supports PNIs and/or other overlay VLANs

- Enables precise fine-grained control over MAC addresses

  - Static MAC provisioning and proxy ARP/ND from PEs can reduce or eliminate unknown unicast
  - Per-MAC loop control vs per-port or per-VLAN isolates potential loops
  - Works together with edge port hygiene features to provide a clean and secure peering fabric

Alcatel·Lucent

INTERNET EXCHANGE POINT
PEERING FABRIC

EVPN Peering Fabric

Port Hygiene at Edge Ports
- EVPN provides the technology for the peering fabric and MAC/IP management over the core

- Still need to use existing port security mechanisms and follow BCPs for port hygiene and allowed traffic

  - Typically allow IPv4, IPv6, ARP and block unwanted traffic types
  - MAC address locking
  - BUM control

Alcatel·Lucent
